ABSTRACT

Wikipedia is more than an online encyclopedia. It is also a news channel as well as a self-updating history book. A global readership can follow political events as they unfold, written about by local people and later edited by other volunteers. This thesis describes a method to answer the question to what extent local volunteers write about events in their own country. First, the geographic origin of each individual article contribution is determined. In a second step, a given article is annotated with georeferences on a word level. The properties of these annotations then allow for a statistical geographic analysis of a single article or a category of articles.

ZUSAMMENFASSUNG

Als Online-Enzyklopädie ist Wikipedia nicht nur Nachschlagewerk sondern auch ein sich stetig wandelndes Geschichtsbuch. Eine global verteilte Nutzerschaft liest und schreibt über lokale Ereignisse noch während sie passieren. Diese Arbeit beschreibt eine Methode zur Bestimmung des Anteils an Beiträgen, die vom betreffenden Land ausgehen. In einem ersten Schritt werden die geographischen Ursprünge aller Beiträge eines Artikels ermittelt. Mit den daraus erhaltenen Georeferenzen wird der Artikel Wort für Wort annotiert. Basierend auf diesen Annotationen kann dann der lokale Autoren-Anteil bestimmt werden.

THOUGHTS

INTRODUCTION

If you are open to contributions from others, you generally end up with richer, better, more diverse and expert content than if you try to do it alone.¹

— Alan Rusbridger, editor of THE GUARDIAN

At the end of January 2011, when a wave of public protest spilled from Tunisia into Egypt, a small group of opposition parties and political activists called for a “Day of Rage” via Facebook, a social networking website. By January 25th their Facebook group had more than 80,000 supporters who drew attention to and helped organize the country-wide protests that followed. As people rallied the streets day after day, the Egyptian government first limited access to Twitter, a micro-blogging service, before cutting Egypt off the internet completely on January 28th.[2, 3]

In what came to be known as the Arab Spring, the use of online networks directly influenced the political development. While Facebook played a part in organizing the protests, Twitter acted as an information channel during the demonstrations. As the events unravelled, they were reflected by articles created on Wikipedia, an online encyclopedia. Updated by the minute, the articles covering the protests formed a well of news reports.[4]

Wikipedia’s free access and open editing policy as well as a quality level—putting it “head to head”[5] with Encyclopedia Britannica—turned it into a hugely popular website[6]. The server software used for the website, MediaWiki², ensures that the effort to change an article is minimal. Given an Internet connection and a web browser, anyone can add or edit an account of current events in a related article and publish it in a matter of seconds.

This form of news production turns the encyclopedia into a news channel that is constantly updated and corrected by an army of volunteers. The result is a self-governed news source that lends itself the aura of authority and credibility of a knowledge reference. At the same time a technophile public that uses the Internet as an efficient means of news acquisition, can check facts on Wikipedia and act upon the consumed information.[7, p. 424–427] Therefore the collective authorship of such a news

² <http://www.mediawiki.org> (visited on 10/31/2011)

medium could have a direct influence on the political decision-making process. As ordinary people become producers of journalism the need arises to analyze these contributions. To investigate, this thesis focuses on the geographic origins of contributions to Wikipedia articles.

Political events are often limited to a country or region. This is reflected by the Wikipedia articles covering the Arab Spring: there is an overarching parent article³ as well as single articles covering the revolution in each of the affected countries, e.g. Egypt⁴ and Libya⁵. The events in the latter country also exemplify how divided the political actors can be. While nearly all revolutionaries welcomed the airstrikes, one faction was concerned about foreign meddling and another one just opposed the deployment of ground troops.[8]

The collective authorship could be equally divided. Despite Wikipedia's core policy to oblige everyone to write from a *neutral point of view*⁶ (NPOV), people regularly express opinions. The collision of opinions in a collectively written article can result in a prolonged series of an edit and its subsequent reversal by another person. The resulting edit pattern is known as an *edit war*. [9] These clashes of opinion create a potential for further investigation into the geopolitics of article contribution. Where do the first reports of an event originate? As later iterations of revisions turn these reports into historical accounts, are these editors from the same country? And more generally, to what extent is a collection of these articles written by volunteers located at the respective location of the event.

In this thesis I will propose a method to help answer these questions. By trying to determine the geographic origin of each edit to an article I will be able to calculate the geographic distribution of contributors. This distribution will then be used to answer the questions above for either a single article or a collection. *Include complete summary and key findings?*

1.1 STRUCTURE

complete over time, name the basic chapters and their function, one part = one paragraph

The chapter **FOUNDATION** provides background information about **Wikipedia**, article editing (**Contributions**) and the applica-

⁶ http://en.wikipedia.org/wiki/Wikipedia:Neutral_point_of_view (visited on 12/08/2011)

tion of geographic data ([Georeferences](#)). The first part ends with [HYPOTHESES](#) where I propose the research questions that this thesis hopes to answer.

In [APPARATUS](#) I will describe the tools available to be used in the method that will be applied to a host of articles in [EXPERIMENTS](#). The findings will be presented in [RESULTS](#). Followed by a discussion of their feasibility in [CONCLUSION](#).

Wikipedia is a phenomenon that has attracted researchers across all fields, notably computer science and sociology, who have written over 1,000 reports on the subject to date. Nielsen [10] compiled an overview of Wikipedia research¹ and divides these publications into four categories:

CONTENT PRODUCTION Covering all aspects of voluntary production such as motivation, collaboration, coverage and bias, quality and vandalism, actuality and geography.

INFORMATION USE Treating how the resulting corpus is being used, e.g. Wikipedia citation in research, use in court, trend-spotting, natural language processing and automatic translation tools, thesaurus construction or categorization.

IMPROVEMENT These are studies concerned with the improvement of both the software used by Wikipedia and the content, e.g. automatic linking, improved editors as well as quality and trust indicators.

COMMUNICATION Studies in this category look at Wikipedia as an online collaboration tool for education and research.

This thesis falls into the first category, content production, as it examines the geography of article contributions that will become part of the Wikipedia's corpus. After a short overview of Wikipedia from a user's perspective, I will introduce its model of collective authorship and present prior research of concerning location and geography.

2.1 WIKIPEDIA

Wikipedia is an online encyclopedia with editions in over 260 languages. Counting 3.6 million articles, the English version is by far the biggest. However, other language editions differ sharply in size and usage.[11] If articles covering the same topic exist in other language editions, these are connected by interwiki links.

¹ Another resource is the Wikimedia Foundation's own directory of Wikipedia research projects at <http://meta.wikimedia.org/wiki/Research:Projects> (visited on 10/12/2011).

2.1.1 History [12]

Wikipedia was officially started on 15 January 2001 by Jimmy Wales and Larry Sanger. Wales previously founded Nupedia, a free and peer-reviewed online encyclopedia written only by experts. However, the speed of content production was extremely low. Wikipedia was founded as a feeder project to collectively write on articles before these entered Nupedia's review process. Wikipedia then quickly created other language editions and dwarfed its predecessor².

After being mentioned on Slashdot, a technology news website, in March 2001 Wikipedia quickly attracted new users. This tech-savvy folk created new articles at a staggering rate of 1,500 articles per month in the first year. These articles then quickly started showing up in Google's search results, attracting even more new users. The non-English editions grew slower but as a group accounted for 75% of all articles in 2007. By 2011 the combined article count passed 20 million.

2.1.2 Wikimedia Foundation

Foundation structure, independence of language wikis, funding

2.1.3 Anatomy of an article

Image: graphic of article UI

describe article anatomy, info boxes with dates and geotags

Some articles contain geographic coordinates as part of the content, e.g. the article about the *Brandenburg Gate*³ in Berlin is tagged with the coordinates 52°30'58.58"N 13°22'39.80"E. However, these articles are geographic in nature treating cities, rivers and places of interest. This thesis hopes to expand the spatial analysis of contributions to articles that have a location property only by association, e.g. the *Egyptian Revolution of 2001*⁴, that clearly happened in *Egypt*⁵.

² Only 24 articles were completed in Nupedia's review process. The project was officially ended in 2003.

⁵ <http://en.wikipedia.org/wiki/Egypt> (visited on 10/31/2011)

2.1.4 Editing

Anyone with a browser and internet access can edit Wikipedia's articles⁶. In collaboration, people all over the world contribute and improve the content. Each edit creates a new revision of the article and is stored in the revision history. Naturally, each article available today started from an empty page and is the result of a succession of edits.

In the revision history each entry consists of the text change, the date of submission, the user and an optional comment explaining the change. Each revision can not only be examined by other users and but also reverted. To minimize the potential for *edit wars*[9] Wikipedia urges its users to discuss controversial topics on the article's talk page.

Image: revision history

Contributions to an article can be done anonymously or as a registered user. A registered user gains privileges like the ability to create articles or the use of the social network features in Wikipedia. With the initial registration a *user page* is created where the user is allowed to publish a profile and interact with other registered users.[14] The majority of edits comes from registered users, anonymous edits account for a quarter of all edits.[15]

A third group of editors are automatic programs known as *bots*. They perform routine tasks ranging from spell-checking over curse word detection to automatic reverts on vandalism. Currently the English Wikipedia alone has nearly approved 1,500 bot tasks running.[16]

2.1.5 User pages

write about user pages, prose, boxes

2.2 CONTRIBUTIONS

Wikipedia's articles are continuously edited by its users. The nature of an edit can range from simple spelling or grammar correction, over improving the content of a sentence to writing or removing of paragraphs or even whole articles. This collective authorship makes it difficult to determine an individual author's contributions, in other words, it is not easy to tell who wrote what.

Research in this area tends to be motivated by the desire to identify individual authors with a good reputation in order to

⁶ Some articles can be locked because of sustained vandalism or content disputes.[13]

assign a trust score to them. This is based on the assumption that trusted authors consistently produce high quality contributions that outlive contributions of lower quality. Kramer, Gregorowicz, and Iyer [17] devised a method to assign trust scores to the authors of an article by examining the wealth of information contained in the article's revision history. They looked at an article as being a set of phrases. The author who first wrote a sentence gets the credit for that phrase and will gain trust if it survives future edits.⁷

A similar approach of calculating the longevity of text chunks was followed by Adler and De Alfaro [18]. They adapted standard text-diff algorithms to the peculiarities of the wiki revision system, e.g. keeping track of text chunks that were removed at one point and then reinserted in later revisions. Based on these algorithms a reputation system was implemented by Adler et al. [19] which offers an API⁸ that can annotate a Wikipedia article. The annotated text is the result of splitting the original text into chunks and attributing them with their respective authors, the number of the revision where the chunk was added and a trust value for the author.⁹

2.3 GEOREFERENCES

"Combined approaches (i.e., where quantitative spatial analysis models are calibrated with surveyed locations) may prove useful." [20, p. 85]

In order to analyze the localness of contributions, it is necessary to geotag them, i.e. applying geospatial metadata like coordinates to each contribution, derived from the author's location. In his doctoral thesis Hardy [20] used the Wikipedia corpora to study the spatial behavior of article production. The dataset was limited to anonymous users and articles that were geotagged.

For each anonymous contribution an IP address, belonging to the point of Internet access, is stored in the revision that is created. Various methods to determine the geographic location from a given IP address have been studied by Muir and Oorschot

⁷ Kramer, Gregorowicz, and Iyer [17] define a sentence as an n-gram—a sequence of n words—and use a sliding window model to follow it across revisions to prevent simple rearrangements of text from counting as a new sentence.

⁸ <http://www.wikitrust.net/vandalism-api> (visited on 10/31/2011)

⁹ Adler et al. also released a Firefox add-on that highlights untrustworthy passages when viewing Wikipedia articles: <https://addons.mozilla.org/en-US/firefox/addon/wikitrust/> (visited on 11/15/2011).

[21]. Various visualizations^{10 11} of edit distributions use geolocation databases like MaxMind¹² and Quova¹³.

For registered users, the IP address is not stored with the revision. Therefor IP geolocation services cannot be used. Lieberman and Lin [22] found an interesting approach by assuming users prefer to edit geographic articles in their proximity. The approximated user location was derived from the center of the convex hull around those articles.

Registered users are also given the opportunity to create a personal profile in their *user page*. The user can choose prose or structured boxes to reveal information like his general interests, spoken languages, but also his location. When entity names can be extracted from location information they can lead to coordinates as shown by Hecht and Gergle [23].

3

HYPOTHESES

To gain insight on how Wikipedia is being used during and after political events¹, and ultimately whether articles covering the events are written by people that are most affected, I will propose a set of hypotheses aimed at different aspects of article production.

For this thesis I will use the event definition proposed by Lewis [24, p. 243]:

“An event is a localized matter of contingent fact.
[...] An event occurs in a particular spatiotemporal region.”

It follows that events must have clear spatial and temporal boundaries. The spatial boundaries give it a location, distinguishing the where. The temporal boundaries, namely the start and the end date, divide the event into three intervals: *before*, *during* and *after*.² Let further me further denote the *beginning* of an event as the first three days of an event.³ In conjunction with location this division into time intervals allows for a detailed look into [Article creation](#), the level of [Participation](#) in following intervals as well as [Text survival](#).

3.1 ARTICLE CREATION

The use of Wikipedia concerning a political event starts with the creation of the article describing the event. Due to the website’s popularity I would expect the delay between the start date and the date of article creation to be rather short. Moreover, considering the rising year-on-year Wikipedia usage in numbers of pages viewed[6], this delay should become shorter and shorter suggesting an increased use of Wikipedia as a news channel. This leads to the following hypotheses:

HYPOTHESIS 1. Articles are created with only a short delay after the start date of the event.

¹ I will not try to argue what makes an event political but rather identify a set by picking a suitable category of articles.

² For ongoing events the end date will be the date of the analysis.

³ The interval was picked arbitrarily but acknowledges the fact that event dates in Wikipedia articles rarely carry a time attribute, therefore a shorter interval, say 24 hours, is less feasible.

HYPOTHESIS 2. The more recent an article, the shorter is the delay between the event start and article creation.

A user has the chance to create a new article in any of the 260-odd language editions of Wikipedia. Although the English version is by far the biggest and most used, it would be interesting to see whether it is the prime choice to create the first article for a new event. Shortly after the first article has been created, articles covering the same topic will be created across various editions of Wikipedia. These articles are then being linked, mostly manually, via inter-wiki links.⁴ When studying knowledge diversity across language editions, Hecht and Gergle [26] found that the English edition is not the superset of concepts of all editions as was previously believed. This means authors retain knowledge they consider important only to their compatriots. For a citizen of a country where English is not the first language creating an article becomes a political decision: should the author make the information available to fellow citizens or to a world-wide readership. However, picking English, even though it is not an official language of the country where the event is happening, would further support Wikipedia's role as a news channel, thus:

HYPOTHESIS 3. Articles are being created first in the English Wikipedia.

Regarding the localness of contributions, Hardy [20, p. 57] has established that Wikipedians write about places in their proximity more often than distant ones. His sample included only articles that have a geotag. Naturally, articles about geographic places like towns and sights⁵ will dominate this sample. Since my thesis is concerned with political events, I find this point to be worth revisiting⁶ for the people most affected should be the ones creating the article, thus:

HYPOTHESIS 4. Articles about political events are created by people in the events' proximity⁷.

⁴ Adar, Skinner, and Weld [25] found that between two languages the inter-linking is not symmetrical, i.e. the number of out-links does not match the number of in-links. Links are either missing on one side or the respective topics are not congruous and the user intentionally left out one direction.

⁵ According to Kittur, Chi, and Suh [27] articles about *geography and places* are third biggest group.

⁶ In addition, Hardy [20, p. 61] considered only anonymous users. Since creating an article is only allowed for registered users, his method has to be extended.

⁷ Hardy [20, p. 57] defined proximity not in absolute terms, rather he considered the likeliness of authors being located less far than the average distance between an article and all its contributors.

3.2 PARTICIPATION

A Wikipedia article usually has more than one author. Once it has been created, users from around the globe can edit an article collectively. Viégas, Wattenberg, and Dave [28] tried to find patterns in the revision history that would reveal certain aspects of collaboration or the lack thereof, e.g. discussions and vandalism.⁸ In respect to authorship, the researchers found the proportions of anonymous contributions differed strongly from page to page while showing no preference to any topic. This inconclusive result and the age of the sample⁹ merits further investigation.

In 2007, Kittur et al. [29] found that a core of registered users is still doing the bulk of all edits. However, anonymous users contribute considerable amounts of text. For accounts of political events, due to their dynamic nature, I expect a strong participation by unregistered users while the events are still unfolding:

HYPOTHESIS 5. In the beginning of the event anonymous users contribute more than registered users.

HYPOTHESIS 6. For the duration of the event there are more local contributions than distant ones.

When the political event is considered “over” its end date in the article changes from “present” to a calendar date. In this unbounded and final phase I would expect the flood of contributions to subside and the content to consolidate when editors tighten prose or remove text they believe to be irrelevant. Looking at the whole lifespan of an article I would also expect registered users to outnumber anonymous ones as suggested by Kittur et al. [29] and the spatial distribution of contributions to become less local. Thus the final hypotheses:

HYPOTHESIS 7. Articles of a political event that has ended will continuously shrink in size.

HYPOTHESIS 8. After an event has ended, there will be more contributions from registered users than from anonymous ones.

HYPOTHESIS 9. After an event has ended, the spatial distribution of the contributors will become less local.

⁸ Using their history flow visualization Viégas, Wattenberg, and Dave [28] first identified patterns in single articles and later tried to statistically confirm their prevalence by analyzing the complete English corpus.

⁹ Viégas, Wattenberg, and Dave [28] used a dataset from May 2003.

3.3 TEXT SURVIVAL

In 3.2 the contributions are only treated in volume giving credit to each contributor. However, when multiple authors write the same article, they do not only add text but also modify or even delete parts. A user who reads an article will only see the text that has survived all edits after it was added. Viégas, Wattenberg, and Dave [28] found that early contributions have a high survival rate. Recognizing this *first-mover advantage*, I suspect that accounts of political events show a strong localness in the beginning. Thus the key hypotheses from 3.2 have to be extended to reflect the spatial distributions of the contributions that make up the article:

HYPOTHESIS 10. For the duration of the event the article text contains more local contributions than distant ones.

HYPOTHESIS 11. After an event has ended, the spatial distribution of the surviving contributions will become less local.

This concludes the statement of the hypotheses. To test them, I will develop an APPARATUS and the EXPERIMENTS in the next part.

Part II

METHODS

APPARATUS

This chapter describes the data structures behind Wikipedia articles and the revision history as well as tools to retrieve and analyze those.

4.1 AVAILABLE DATA

A lot of Wikipedia's content like articles, revisions, discussions is stored on its database servers. Unfortunately, these databases are not directly accessible over the Internet. The Wikimedia Foundation, however, makes a lot of the data available in the form of database dumps or through an API.

4.1.1 *Database dumps*

Monthly database snapshots of all wikis run by the Wikimedia Foundation, including Wikipedia, are publicly available¹ as database dump files in the XML file format. For each of the wikis a variety of dumps is available that include all articles and, optionally, their edit history, all categories, interwiki-links, etc. These dump files can be quite large, e.g. a compressed dump of all articles of the English Wikipedia in their current revision has a size 7.3 GB.²

This huge size makes processing them rather slow.³ When analyzing only a single article or a category articles, the MediaWiki API can deliver the same information contained in the dumps.

4.1.2 *MediaWiki API*

Wikipedia runs on the server software MediaWiki which offers an API to access wiki features, e.g. changing content and restoring revisions, as well as queries to article properties, e.g. revisions and categories. The API also offers an article export including all revisions.⁴

¹ <http://dumps.wikimedia.org> (visited on 12/11/2011)

² The uncompressed size is 31.0 GB, see http://en.wikipedia.org/wiki/Wikipedia:Database_download (visited on 12/11/2011)

³ The project WikiHadoop addresses this problem by offering a stream task format to be used in Hadoop (MapReduce) infrastructure, see <https://github.com/whym/wikihadoop> (visited on 12/11/2011).

⁴ Similar functionality is also offered via MediaWiki's Special:Export page, e.g. <https://en.wikipedia.org/wiki/Special:Export> (visited on 12/11/2011) allows exporting articles from the English Wikipedia.

The following queries will be important for this thesis:

- *check if a user is a bot*
- *all articles that are member of a category*
- *revisions, includes user names*

4.1.3 Toolserver

The Germany based Wikimedia Deutschland e.V. operates Toolserver⁵, a platform for software tools that can access a copy of Wikipedia's databases. The replicated databases include the English Wikipedia and major language editions. However, access is restricted and requires an account on Wikimedia's Toolserver.

4.2 TOOLS

4.2.1 Toolkits

4.2.2 Analysis projects

This section describes useful toolkits to analyze articles and their revision history.

WIKIPRIDE Python web-application⁶ to visualize contributions of groups of editors that registered in the same month.⁷

WIKI TRIP JavaScript application⁸ that uses the Wikipedia API as well as a toolserver backend to visualize the evolution of a single article over time including: anonymous vs. registered contributors, male vs. female registered users, anonymous edits by country.⁹ Its backend can be reused to identify the gender for registered users who revealed their gender in their account page.¹⁰

- *Revert analyzer and framework to map a processing function on dumps: <https://bitbucket.org/halfak/wikimedia-utilities/>*

⁵ <http://toolserver.org> (visited on 12/11/2011)

⁶ <https://github.com/declerambaul/WikiPride> (visited on 12/11/2011)

⁷ Project website: <http://meta.wikimedia.org/wiki/Research:WikiPride> (visited on 12/11/2011)

⁸ <https://github.com/volpino/wikipedia-timeline> (visited on 12/11/2011)

⁹ Live demo: <http://sonetlab.fbk.eu/wikitrip/> (visited on 12/11/2011)

¹⁰ Try http://toolserver.org/~sonet/api_gender.php?article=Egypt&lang=en (visited on 12/11/2011) to get a list of all registered users who edited the article *Egypt* of the English Wikipedia.

- Page view statistics for a given article: http://stats.grok.se/json/en/201105/2011_Egyptian_Revolution_using_data from <http://dumps.wikimedia.org/other/pagecounts-raw/>

4.3 COLLECTIVE AUTHORSHIP

Introduce types of authors (roles) as well as methods to determine contribution/attribution

- Autoren
- Bots
- Wer überlebt?
- Algorithmen, welche Unterschiede?

4.3.1 Relevant Edits

Are all edits relevant? Edit wars? Bots?

4.4 GEOREFERENCES

- registered vs. unregistered vs. bots vs. admins
- incorporate key findings of [20] as laid out in chapter 2.3
- IPs of unregistered users: Geo lookup
- Autoren-Profile: Information Extraction
- Geographische Zuordnung vom user profile

Zur Bestimmung der Herkunft eines Autors bietet Wikipedia zwei direkte Ansätze: Für jeden Beitrag eines nicht registrierten Benutzers wird die IP-Adresse gespeichert, über die er Zugang zum Internet erlangt hat. Der zweite Ansatz betrifft die registrierten Benutzer. Ihre IP-Adressen sind maskiert und nicht öffentlich zugänglich.^{11 12} Die registrierten Nutzer können jedoch auf ihrer *user page* Informationen über ihre Person entweder als Freitext oder strukturiert in *user boxes* veröffentlichen.

¹¹ Das WikiWatcher-Teilprojekt *Poor Man's Check User* erlaubt eine Auflösung des Benutzernamens in eine IP-Adresse, wenn dieser Nutzer in der Vergangenheit beim Ändern eines Artikels das Session-Limit überschritten hatte. Inzwischen wurde diese Sicherheitslücke in der WikiMedia-Software jedoch behoben. <http://wikiwatcher.virgil.gr/pmcu>

¹² Eine kleine, von der Wikipedia-Community gewählte Nutzerschaft mit der Berechtigung *checkuser* kann die Adressen demaskieren.

Letztere sind definierte Einheiten mit denen der Nutzer persönliche Eigenschaften wie Herkunftsland, gesprochene Sprachen oder wissenschaftliche Interessen kodifizieren kann. Zusammen decken beide Ansätze jedoch nur einen Teil der Beiträge schreiben den Nutzerschaft ab.

4.4.1 IP Look-up

- *Services*
- *Accuracy*
- *Active prevention by proxies and anonymizers:*
J.A. Muir and P.C. van Oorschot. Internet geolocation and evasion. Tech. rep. Citeseer, 2006
J.A. Muir and P.C.V. Oorschot. „Internet geolocation: Evasion and counterevasion.“ In: ACM Computing Surveys (CSUR) 42.1 (2009), p. 4
M. Duckham and L. Kulik. „A formal model of obfuscation and negotiation for location privacy.“ In: Pervasive Computing (2005), pp. 152–170

Mit frei verfügbaren¹³ Online-Diensten wie *Quova*¹⁴ oder *geoplugin*¹⁵ lässt sich für einen Großteil der IPs daraufhin das Herkunftsland bestimmen.

Im Bezug auf die Herkunft sind sowohl das Land als auch die Geo-Koordinaten interessant. Basierend auf der Versionsgeschichte würde für nicht registrierte Benutzer eine Gewinnung von Daten dann beispielsweise folgende Schritte durchlaufen:

IP \Rightarrow Geolocation-Dienst \Rightarrow Koordinaten und Land

4.4.2 Information Extraction

- *Automatic annotation of entities:* <http://wikipedia-miner.cms.waikato.ac.nz/demos/annotate/>, also has services for categories. Alternative: <http://tagme.di.unipi.it/>
- *IE approach with Machine Learning* L. Xiao et al. „Information extraction from the web: System and techniques.“ In: *Applied Intelligence* 21.2 (2004), pp. 195–224
- *unsupervised IE:* O. Etzioni et al. „Unsupervised named-entity extraction from the web: An experimental study.“ In: *Artificial Intelligence* 165.1 (2005), pp. 91–134

¹³ Die vorgestellten Dienste haben ein tägliches Kontingent an Anfragen. Hilfstechiken wie Caching können diese Einschränkungen jedoch mindern.

¹⁴ <http://developer.quova.com>

¹⁵ <http://www.geoplugin.com/webservices>

- *if city is mentioned, determine country (needs disambiguation, e.g. Berlin)*
- *coordinates are optional?*

4.4.3 Geographic Profiling

- *M.D. Lieberman and J. Lin. „You are where you edit: Locating Wikipedia users through edit histories.“ In: ICWSM’09 (2009), pp. 106–113*
- *B.J. Hecht and D. Gergle. „On the localness of user-generated content.“ In: Proceedings of the 2010 ACM conference on Computer supported cooperative work. ACM. 2010, pp. 229–232*
- *from other fields such as criminal research:
B. Snook et al. „On the complexity and accuracy of geographic profiling strategies.“ In: Journal of Quantitative Criminology 21.1 (2005), pp. 1–26*
- *feasibility, maybe just as enhancer*

4.4.4 Consolidation

- *settle for a resolution*
- *some examples on accuracy for different countries*
- *clustering of origins: areas of influence*

4.5 VISUALIZATION

4.5.1 Maps

OPENLAYERS JavaScript library¹⁶ to render map data in the browser.

- *Darstellung der geographischen Analyse*
- *per Wort, Satz, Artikel, Wort*

Auf Basis der strukturierten Daten in Form von Artikeln, Sätzen, Ländern, Koordinaten und Sprachen sollen nun Visualisierungen gefunden werden, welche die Fülle an Informationen zugänglich machen. Mögliche Visualisierungen wären etwa:

¹⁶ <http://www.openlayers.org/> (visited on 12/11/2011)

- V1 Revisionshistogramm à la Google Finance
- V2 *Heatmap* einer Landkarte mit Ursprüngen der Revisionen
- V3 Netzwerkgrafik, die Metriken desselben Artikels in verschiedenen Sprachvarianten anzeigt
- V4 Dynamisches Blasendiagramm¹⁷ über die Entwicklung unterschiedlicher Sprachvarianten
- V5 *Heatmap* des Artikels mit Stellen höchster Aktivität
- V6 Landeskürzel für eine gegebene Textstelle
- V7 Edit wars on map, linking two or more places

4.5.2 Goals

- A. Kjellin et al. „Evaluating 2D and 3D visualizations of spatiotemporal information.“ In: ACM Transactions on Applied Perception (TAP) 7.3 (2010), pp. 1–23
- *Identify.* Characteristics of an object.
- *Locate.* Absolute or relative position.
- *Distinguish.* Recognize as the same or different.
- *Categorize.* Classify according to some property (e.g., color, position, or shape).
- *Cluster.* Group same or related objects together.
- *Distribution.* Describe the overall pattern.
- *Rank.* Order objects of like types.
- *Compare.* Evaluate different objects with each other.
- *Associate.* Join in a relationship.
- *Correlate.* A direct connection.

4.5.3 Design

4.6 DATA MODEL AND SYSTEM OVERVIEW

- *fetch article*
- *get revision history*
- *determine contributions*

¹⁷ http://en.wikipedia.org/wiki/Motion_chart

- *transform to word attribution*
- *attach georeference*

4.7 ANALYSIS

- *article usage (page views) vs. article production (edits)*
-
-
-
-

5

EXPERIMENTS

5.1 DATA SET

Using Wikipedia's category system. Articles are categorized by people.

- *Choosing the "right" category*
- *Can it be representative?*

Mithilfe der Export-Funktion von Artikeln lässt sich ein kleiner Datensatz generieren, an dem die Anwendung getestet werden kann. Über dieselbe Export-Funktion kann auch eine Kategorie wie zum Beispiel *Revolutions by country*¹ angegeben werden. Als Ergebnis erhält man eine Sammlung von Artikeln über politische Ereignisse.

5.2 APPLICATION

- *Beispielhafte Durchführung*
- *Sammlung der Ergebnisse*

Dabei könnte zum Beispiel sichtbar werden, dass sich ein bestimmter Artikel in verschiedenen Sprachvarianten unterschiedlich entwickelt. Falls ein Land mehrere offizielle Sprachen hat, könnte man diese entweder gruppiert oder einzeln im direkten Vergleich betrachten. Ebenso könnten sich in Anlehnung an die *edit wars* Streitpunkte anhand von Textstellen herauskristallisieren, die besonders umkämpft sind.

¹ http://en.wikipedia.org/wiki/Category:Revolutions_by_country

Part III

RESULTS

6

RESULTS

- *Statistische Auswertung*

Anhand eines ausgewählten Datensatzes von politischen Ereignissen wie *Revolutions by country* soll eine statistische Auswertung erfolgen, um die Frage zu beantworten, wer die Geschichte eines Landes schreibt.

CONCLUSION

- *Interpretation der Ergebnisse*
- *Vermutungen bestätigt*

7.1 LIMITATIONS

- *Mobile contributions, smartphones*
- *Privacy*

7.1.1 *Political events*

The same hypotheses may be applicable to other types of articles than political ones. The key requirements are that they have a location attribute and a time interval. This is easily fulfilled by disaster articles, e.g. Fukushima Daiichi nuclear disaster¹.

7.1.2 *Article location*

Although *location* is central to more abstract concepts like *Culture*² these subjects clearly defy being attributed with *a* location. Nevertheless, an analysis of the spatial distribution of contributors could be interesting.

7.1.3 *Cross-language article growth*

The growth rates of articles covering the same topic across various language editions could be analyzed to further investigate issues like language barrier—locals contributing only in their language—and information arbitrage as suggested by Adar, Skinner, and Weld [25].
